

Process for preparing acylphosphanes and derivatives thereof

The present invention relates to a new, selective process for the preparation of mono- and bisacylphosphanes, mono- and bisacylphosphane oxides or mono- and bisacylphosphane sulfides.

The European Patent Publication EP1 135 399 B1 describes a process for the preparation of mono- and bisacylphosphanes, of mono- and bisacylphosphane oxides and of mono- and bisacylphosphane sulfides, which process comprises first reacting organic P-monohalogenophosphanes or P, P-dihalogenophosphanes or mixtures thereof, with an alkali metal or magnesium in combination with lithium, where appropriate in the presence of a catalyst, and then carrying out the reaction with acid halides and, in the case of the process for the preparation of oxides, carrying out an oxidation step and, in the case of the preparation of sulfides, reacting the phosphanes so obtained with sulfur. The reaction is usefully carried out in a solvent. The solvent used may be, in particular, ethers which are liquid at normal pressure and room temperature. Examples thereof are dimethyl ether, diethyl ether, methyl-propyl ether, 1,2-dimethoxyethane, bis(2-methoxyethyl)ether, dioxane or tetrahydrofuran. Tetrahydrofuran is preferably used.

The International Application PCT/EP 03/50873, describes a process to prepare cycloorganyl phosphanes of the formula $(R^1P)_n$ by reacting $R^1P\text{Hal}_2$ with an alkali metal or an alkaline-earth metal in an organic solvent such as toluene in the presence of an activator, e.g. N,N,N',N'-tetramethylethylenediamine (TMEDA).

Furthermore, PCT/EP 03/50873 describes the preparation of sodium *catena*-oligophosphane- α,ω -diides, e.g. the preparation of $\text{Na}(\text{L})_3[\text{Na}_5(\text{P}_2\text{Ph}_2)_3(\text{L})_3]$ (L = solvent), which can react with mesitylchloride (MesCO-Cl) to obtain acylphosphanes of the formula $\text{PhP}(\text{COMes})_2$.

H. Schindlbauer et al (Monatshefte Chemie 90 148 [1959]) describes a method for producing phosphanes by reacting $R^1P\text{Hal}_2$ with 4 equivalents of highly dispersed sodium in toluene to obtain $R^1P\text{Na}_2$ and subsequent reaction with alcohol/water. The alcohol used is ethanol.

The Schindlbauer process has the drawback that a considerable amount of undesired by-products are obtained which need to be removed.

- 2 -

Accordingly, there still remains a need for a process to produce acylphosphanes directly from an organic phosphorus halide resulting in a high yield and a substantially complete conversion.

It has been found that the required selectivity can be achieved by using a proton source like sterically hindered alcohols, trialkylamine hydrohalogenes, bisarylamines, malono nitrile, malonic acid esters, amidine hydrohalogene and carboxylic acids.

The invention relates to a process for the preparation of acylphosphanes of formula I

n and **m** are each independently of the other 1 or 2;

R₁, if **n = 1**, is

C₁-C₁₈alkyl, C₂-C₁₈alkyl which is interrupted by one or several non-successive O atoms; phenyl-C₁-C₄alkyl, C₂-C₈alkenyl, phenyl, naphthyl, biphenyl, C₅-C₁₂cycloalkyl or a 5- or 6-membered O-, S- or N-containing heterocyclic ring, the radicals phenyl, naphthyl, biphenyl, C₅-C₁₂cycloalkyl or the 5- or 6-membered O-, S- or N-containing heterocyclic ring being unsubstituted or substituted by one to five halogen, C₁-C₈alkyl, C₁-C₈alkylthio, C₁-C₈alkoxy and/or -N(R₈)₂;

R₁, if **n = 2**, is

C₁-C₁₈alkylene, C₂-C₁₈alkylene which is interrupted by one or several non-successive O atoms; or **R₁** is C₁-C₆alkylene which is substituted by C₁-C₄alkoxy, phenyl, C₁-C₄alkyl-phenyl, phenyl-C₁-C₄alkyl or C₁-C₈alkoxyphenyl; or **R₁** is phenylene or xylylene, which radicals are unsubstituted or substituted by one to three C₁-C₄alkyl and/or C₁-C₄alkoxy, or

R₁ is a -CH₂CH=CHCH₂-, -CH₂-C≡C-CH₂-, -CH₂CH₂--CH₂CH₂-,

R₂ is C₁-C₁₈alkyl, C₃-C₁₂cycloalkyl, C₂-C₁₈alkenyl, phenyl-C₁-C₄alkyl, phenyl, naphthyl, biphenyl or a 5- or 6-membered O-, S- or N-containing heterocyclic ring, the radicals

- 3 -

phenyl, naphthyl, biphenyl or the 5- or 6-membered O-, S- or N-containing heterocyclic ring being unsubstituted or substituted by one to five halogen, C₁-C₈alkyl, C₁-C₈alkoxy and/or C₁-C₈alkylthio;

R₃ is C₁-C₁₈alkyl, C₂-C₁₈alkyl which is interrupted by one or several non-successive O atoms or which is interrupted by -CO-, -COO-, -OCO-, -OCOO-, -CO-N(R₉)-, -N(R₉)-CO-, -N(R₉)-CO-N(R₉)-, -N(R₉)-COO-; C₁-C₁₈ alkyl substituted by -OR₁₀, -OCO-R₁₀, -COO-R₁₀, -N(R₉)-CO-R₁₀, -CO-N(R₉)-R₁₀, -C(R₁₁)=C(R₁₂)-CO-OR₁₀ or -C(R₁₁)=C(R₁₂)-phenyl;

C₂-C₁₂alkenyl or C₂-C₁₂alkenyl which is interrupted by one or several non-successive O atoms; phenyl-C₁-C₄alkyl, phenyl, naphthyl, biphenyl, C₅-C₁₂cycloalkyl or a 5- or 6-membered O-, S- or N-containing heterocyclic ring, the radicals phenyl, naphthyl, biphenyl, C₅-C₁₂cycloalkyl or the 5- or 6-membered O-, S- or N-containing heterocyclic ring being unsubstituted or substituted by one to five halogen, C₁-C₈alkyl, C₁-C₈alkylthio C₁-C₈alkoxy and/or -N(R₉)₂; or **R₃** is -CO-OR₉ or -CO-N(R₉)₂;

Q is a single bond, CR₆R₇, -O- or -S- ;

R₄ and **R₅** are each independently of the other hydrogen, C₁-C₄alkyl or C₁-C₄alkoxy;

R₆ and **R₇** are each independently of the other hydrogen or C₁-C₄alkyl;

R₈ is C₁-C₁₈ alkyl, C₂-C₁₈ alkyl which is interrupted by one or several non-successive O-atoms; or -N(R₈)₂ forms a 5- or 6-membered O-, S- or N-containing heterocyclic ring;

R₉ is hydrogen, C₁-C₁₈alkyl, C₂-C₁₈alkyl which is interrupted by one or several non-successive O atoms, C₃-C₁₂-cycloalkyl, C₂-C₁₈-alkenyl, phenyl-C₁-C₄-alkyl, phenyl, naphthyl, pyridyl, the radicals phenyl, naphthyl or pyridyl being unsubstituted or substituted by one to five C₁-C₈-alkyl, C₁-C₈-alkoxy, C₁-C₈-alkylthio and/or halogen; or -N(R₉)₂ forms a 5- or 6-membered O-, S- or N-containing heterocyclic ring;

R₁₀ is C₁-C₁₈alkyl, C₂-C₁₈alkyl which is interrupted by one or several non-successive O-atoms, C₃-C₁₂-cycloalkyl, phenyl-C₁-C₄-alkyl, C₂-C₁₈-alkenyl, phenyl, naphthyl, biphenyl; the radicals phenyl-C₁-C₄-alkyl, phenyl, naphthyl or biphenyl being unsubstituted or substituted by one to five C₁-C₈-alkyl, C₁-C₈-alkoxy, C₁-C₈-alkylthio and/or halogen;

R₁₁ is hydrogen or C₁-C₄-alkyl;

R₁₂ is hydrogen or C₁-C₄-alkyl;

by

- (1) reacting a phosphorous halide of formula IIa or a phosphorous halide oxide of formula IIb or a phosphorous halide sulfide of formula IIc

- 4 -

wherein R_1 , R_3 , n and m have the meaning cited above and Hal is F, Cl, Br or I;

with an alkali metal in a solvent in the presence of a proton source like sterically hindered alcohols, trialkylamine hydrohalogenes, bisarylamines, malono nitrile, malonic acid esters, amidine hydrohalogene and carboxylic acids;

- (2) subsequent reaction with m acid halides of formula III

wherein R_2 , Hal and m have the meaning cited above.

In another of its aspect, this invention relates to a process for the preparation of **monoacylphosphanes** of the formula I' (compounds of the formula I with $n=1$ and $m=1$)

wherein R_1 , R_2 and R_3 are as defined above,

by

- (1) reacting organic phosphorus halides of formula II'

wherein R_1 and Hal are as defined above,

with an alkali metal in a solvent in the presence of a proton source like sterically hindered alcohols, trialkylamine hydrohalogenes, bisarylamines, malono nitrile, malonic acid esters, amidine hydrohalogene and carboxylic acids;

- (2) subsequent reaction with an acid halide of formula III'

wherein R_2 and Hal are as defined above,

followed by the reaction with an electrophilic compound $R_3\text{-Hal}$, wherein R_3 and Hal are as defined above, or vice versa.

- 5 -

The sequence of addition of the acid halide and the compound $R_3\text{-Hal}$ can be interchanged. Thus, it is possible to add first the compound $R_3\text{-Hal}$ and then the acid halide.

In another of its aspect, this invention relates to a process for the preparation of **symmetric bisacylphosphanes** of the formula I'' (compounds of the formula I with $n=1$ and $m=2$)

wherein R_1 and R_2 are as defined above by

- (1) reacting organic phosphorus halides of formula II''

wherein R_1 and Hal are as defined above,

with an alkali metal in a solvent in the presence of a proton source like sterically hindered alcohols, trialkylamine hydrohalogenes, bisarylamines, malono nitrile, malonic acid esters, amidine hydrohalogene and carboxylic acids;

- (2) subsequent reaction with an acid halide of formula III''

wherein R_2 and Hal are as defined above.

In another of its aspect, this invention relates to a process for the preparation of **un-symmetric bisacylphosphanes** of the formula I''' (compounds of the formula I with $n=1$ and $m=2$)

wherein R_1 is as defined above and R_2 and R_2' independently of one another are as defined above under R_2 with the proviso that R_2 is not equal R_2'

by

- (1) reacting organic phosphorus halides of formula II''

- 6 -

wherein R_1 and Hal are as defined above,

with an alkali metal in a solvent in the presence of a proton source like sterically hindered alcohols, trialkylamine hydrohalogenes, bisarylamines, malono nitrile, malonic acid esters, amidine hydrohalogene and carboxylic acids;

- (2) subsequent reaction with an acid halide of formula III''

wherein R_2 and Hal are as defined above ,

- (3) subsequent reaction with a second acid halide III'''

wherein R_2' and Hal are as defined above.

In another of its aspects, this invention also relates to a process for the preparation of mono acylated phosphanes of the formula VI and VI'

where R_1 , R_2 , R_2' are defined as above and Me is Li, Na, K,
by

- (1) reacting organic phosphorus halides of formula II''

wherein R_1 and Hal are as defined above,

with an alkali metal in a solvent in the presence of a proton source like sterically hindered alcohols, trialkylamine hydrohalogenes, bisarylamines, malono nitrile, malonic acid esters, amidine hydrohalogene and carboxylic acids;

- (2) subsequent reaction with an acid halide of formula III'' or III'''

- 7 -

wherein R_2 , R_2' and Hal are as defined above.

The mono acylated phosphanes of formula VI and VI' can be isolated by standard techniques known to the person skilled in the art.

Compounds of formula VI and VI' can serve as starting materials for the synthesis of compounds of formula I', I'' and I''' as described above.

In another aspect of the invention step (1) is carried out by reacting diphosphanes of the formula $(\text{R}_1)_2\text{P}-\text{P}(\text{R}_1)_2$ or polyphosphanes of the formula $[\text{R}_1\text{P}]_n$, wherein R_1 is as defined above and n is ≥ 3 , with an alkali metal in a solvent in the presence of a proton source like sterically hindered alcohols, trialkylamine hydrohalogenes, bisarylamines, malono nitrile, malonic acid esters, amidine hydrohalogene and carboxylic acids; followed by the reaction with acid halides (III, III', III'', III''') and/or by reaction with electrophilic compounds $\text{R}_3\text{-Hal}$.

In another of its aspects, this invention relates to a process for the preparation of acylphosphane oxides and acylphosphane sulfides of formula IV

R_1 , R_2 , R_3 , n and m are as defined above, and Z is O or S,

by oxidation or reaction with sulfur of the acylphosphane of formula I, I', I'' or I'''.

The proton source is selected from sterically hindered alcohols, trialkylamine hydrohalogenes, bisarylamines, malono nitrile, malonic acid esters, amidine hydrohalogene and carboxylic acids.

- 8 -

The sterically hindered alcohol is selected from the group consisting of secondary or tertiary C_3 - C_{18} alcohols, preferably of t-butanol, tert.-amyl-alcohol, 3-methyl-3-pentanol, 3-ethyl-3-pentanol, triphenylmethanol, 3,7-dimethyl-3-octanol, 2-methyl-1-phenyl-2-propanol, 2-methyl-4-phenyl-2-butanol, fenchyl alcohol, 2,4-dimethyl-3-pentanol, 1-dimethylamino-2-propanol or hexylene glycol.

The trialkylamine hydrohalogene is selected from tert. $(C_1-C_8)_3N-HCl$, preferably trimethylamine hydrochloride, triethylamine hydrochloride or tributylamine hydrochloride.

Suitable alkali metals are lithium, sodium or potassium, preferably sodium. It is also possible to use magnesium in combination with lithium.

C_1 - C_{18} Alkyl is linear or branched and is, for example, C_1 - C_{12} -, C_1 - C_8 -, C_1 - C_6 - or C_1 - C_4 alkyl. Examples are methyl, ethyl, propyl, isopropyl, n-butyl, sec-butyl, isobutyl, tert-butyl, pentyl, hexyl, heptyl, 2,4,4-trimethylpentyl, 2-ethylhexyl, octyl, nonyl, decyl, undecyl, dodecyl, tetradecyl, pentadecyl, hexadecyl, heptadecyl or octadecyl.

C_1 - C_{12} -, C_1 - C_6 - and C_1 - C_4 Alkyl are also linear or branched and have, for example, the meanings cited above up to the corresponding number of carbon atoms.

C_2 - C_{18} Alkyl, which is interrupted once or several times by non-successive -O-, is interrupted, for example, 1-9, e.g. 1-7, 1-5, 1-3 or 1 or 2, times by -O-, the O atoms always being interrupted by at least one methylene group. The alkyl groups may be linear or branched. The structural units obtained are thus, for example, $-CH_2-O-CH_3$, $-CH_2CH_2-O-CH_2CH_3$, $-[CH_2CH_2O]_y-CH_3$, where $y = 1-8$, $-(CH_2CH_2O)_7CH_2CH_3$, $-CH_2-CH(CH_3)-O-CH_2-CH_2CH_3$ or $-CH_2-CH(CH_3)-O-CH_2-CH_3$.

C_2 - C_{18} Alkenyl radicals may be mono- or polyunsaturated, linear or branched and are, for example, vinyl, allyl, methallyl, 1,1-dimethylallyl, propenyl, butenyl, pentadienyl, hexenyl or octenyl, preferably vinyl or allyl. R_2 defined as C_2 - C_{18} alkenyl is typically C_2 - C_8 -, C_2 - C_6 -, preferably C_2 - C_4 alkenyl.

C_5 - C_{12} Cycloalkyl is, for example, cyclopentyl, cyclohexyl, cyclooctyl, cyclododecyl, preferably cyclopentyl and cyclohexyl, more preferably cyclohexyl. C_3 - C_{12} Cycloalkyl is additionally e.g. cyclopropyl.

C₁-C₈Alkoxy is linear or branched radicals and is typically methoxy, ethoxy, propoxy, isopropoxy, n-butyloxy, sec-butyloxy, isobutyloxy, tert-butyloxy, pentyloxy, hexyloxy, heptyloxy, 2,4,4-trimethylpentyloxy, 2-ethylhexyloxy or octyloxy, preferably methoxy, ethoxy, propoxy, isopropoxy, n-butyloxy, sec-butyloxy, isobutyloxy, tert-butyloxy, most preferably methoxy.

Halogen is fluoro, chloro, bromo and iodo, preferably chloro and bromo, most preferably chloro.

Examples of O-, S- or N-containing 5- or 6-membered heterocyclic rings are furyl, thienyl, pyrrolyl, oxinyl, dioxinyl or pyridyl. The cited heterocyclic radicals may be substituted by one to five, e.g. by one or two, linear or branched C₁-C₈alkyl, halogen and/or C₁-C₈alkoxy. Examples of such compounds are dimethylpyridyl, dimethylpyrrolyl or methylfuryl.

Examples for -N(R₈)₂, -N(R₉)₂ forming a 5- or 6-membered O-, S- or N-containing heterocyclic rings are:

with R₈ as defined above.

Substituted phenyl, naphthyl or biphenyl is substituted by one to five, e.g. by one, two, three or four, preferably by one, two or three, for example linear or branched C₁-C₈alkyl, linear or branched C₁-C₈alkoxy or by halogen.

Preferred substituents for phenyl, naphthyl and biphenyl are C₁-C₄alkyl, preferably methyl, C₁-C₄alkoxy, more preferably methoxy, and chloro. Particularly preferred substituents are, for example, 2,4,6-trimethylphenyl, 2,6-dichlorophenyl, 2,6-dimethylphenyl or 2,6-dimethoxyphenyl.

R₂ is, for example, C₁-C₁₈alkyl or phenyl, preferably 2,4,6-trimethylphenyl, 2,6-dimethylphenyl or 2,6-dimethoxyphenyl, most preferably 2,4,6-trimethylphenyl.

R₁ and R₃ are preferably unsubstituted phenyl, C₁-C₈alkyl-substituted phenyl or C₁-C₈alkoxy-substituted phenyl, most preferably phenyl.

- 10 -

R_1 , defined as C_1 - C_{18} alkylene is linear or branched alkylene, such as methylene, ethylene, propylene, isopropylene, n-butylene, sec-butylene, isobutylene, tert-butylene, pentylene, hexylene, heptylene, octylene, nonylene, decylene, dodecylene, tetradecylene, heptadecylene or octadecylene. R_1 is preferably C_1 - C_{12} alkylene, e.g. ethylene, decylene, —CH— , $\text{C}_{11}\text{H}_{23}$

If R_1 is C_2 - C_{18} alkylene which is interrupted by one or several non-successive O atoms, then structural units such as $\text{—CH}_2\text{—O—CH}_2\text{—}$, $\text{—CH}_2\text{CH}_2\text{—O—CH}_2\text{CH}_2\text{—}$, $\text{—[CH}_2\text{CH}_2\text{O}]_y\text{—}$ are obtained, where $y = 1-9$, $\text{—(CH}_2\text{CH}_2\text{O)}_7\text{CH}_2\text{CH}_2\text{—}$ or $\text{—CH}_2\text{—CH(CH}_3\text{)—O—CH}_2\text{—CH(CH}_3\text{)—}$.

If alkylene is interrupted by several O atoms, then these O atoms are always separated from each other by at least one methylene group.

Phenyl- C_1 - C_4 alkyl is, for example, benzyl, phenylethyl, α -methylbenzyl or α,α -dimethylbenzyl, preferably benzyl. Phenyl- C_1 - C_2 alkyl is particularly preferred.

C_1 - C_4 Alkylphenyl is typically tolyl, xylyl, mesityl, ethylphenyl, diethylphenyl, preferably tolyl or mesityl.

C_1 - C_6 Alkoxyphenyl is phenyl which is substituted by one to four alkoxy radicals, for example 2,6-dimethoxyphenyl, 2,4-dimethoxyphenyl, 2,4 dipentoxyphenyl, methoxyphenyl, ethoxyphenyl, propoxyphenyl or butoxyphenyl.

Phenylene is 1,4-, 1,2- or 1,3-phenylene, preferably 1,4-phenylene.

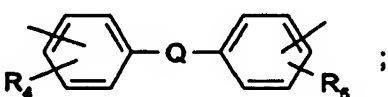

If phenylene is substituted, it is mono- to tetra-substituted, e.g. mono-, di- or trisubstituted, preferably mono- or disubstituted, at the phenyl ring. Xylylene is o-, m- or p-xylylene:

Preferred substituents:

- 11 -

In the above-described processes, R_1 , if $n = 1$, is C_1 - C_{12} alkyl, cyclohexyl, phenyl or biphenyl, the radicals phenyl and biphenyl being unsubstituted or substituted by one to four C_1 - C_8 alkyl and/or C_1 - C_8 alkoxy;

R_1 , if $n = 2$, is C_6 - C_{10} alkylene, or  ;

R_3 is C_1 - C_{12} alkyl, cyclohexyl, phenyl or biphenyl, the radicals phenyl and biphenyl being unsubstituted or substituted by one to four C_1 - C_8 alkyl and/or C_1 - C_8 alkoxy;

Q is a single bond or $-O-$, and R_4 and R_5 are hydrogen.

Compounds to be highlighted in the above processes are those of formula I, wherein R_2 is phenyl which is substituted in 2,6- or 2,4,6-position by C_1 - C_4 alkyl and/or C_1 - C_4 alkoxy.

Compounds of formula I which are particularly preferably used in the above process are those wherein n is 1.

The residue "Hal" is preferably chloro.

Other preferred compounds of formula I in the above process are those, wherein m is defined as the number two, i.e. bisacylphosphane or bisacylphosphane oxides or bisacylphosphane sulfides.

A preferred process is that, wherein in formula, I, n is 1, m is 1 or 2, R_1 is phenyl which is unsubstituted or substituted by C_1 - C_4 alkyl or C_1 - C_8 alkoxy, or R_1 is C_1 - C_{12} alkyl; R_2 is C_1 - C_{18} alkyl or phenyl which is substituted by halogen, C_1 - C_4 alkoxy or C_1 - C_4 alkyl; and R_3 is unsubstituted or C_1 - C_4 alkyl-substituted phenyl.

In the novel process for the preparation of mono- and bisacylphosphanes, an organic phosphorous halide of formula IIa or a phosphorous halide oxide of formula IIb or a phosphorous halide sulfide of formula IIc is first reacted in a solvent with an alkali metal in the presence of a proton source like sterically hindered alcohols, trialkylamine hydrohalogenes, bisarylamines, malono nitrile, malonic acid esters, amidine hydrohalogene and carboxylic acids.

- 12 -

This first step includes two different reaction types, a metallation and a reduction step.

The metallation is carried out by reacting a compound of the formula IIa, IIb, or IIc with an alkali metal in a solvent, whereby a metallized phosphanide of the formula V

is formed together with cyclic phosphanes $(R_1P)_n$, $n \geq 3$ as intermediates. Me is lithium, sodium or potassium or magnesium in combination with lithium and R_1 is as defined above.

It is useful to employ from 4 to 6 atom equivalents of an alkali metal in solid or molten form, preferably sodium, for the preparation of bisacylphosphanes or monoacylphosphanes prepared from R_1PHal_2 , and 2 to 3 atom equivalents of an alkali metal in solid or molten form for the preparation of monoacylphosphanes prepared from $(R_1)_2PHal$. It is not necessary that the alkali metal is highly dispersed.

Catalytic amounts of alkali or earth alkali hydroxides or of Na, K or Li alcoholates or of alcohols, preferably sterically hindered alcohols may be added prior or during the metallation step.

In addition combinations of catalytic amounts of alkali and/or earth alkali metals and/or sterically hindered alcohols may be added prior or during the metallation step.

Catalytic amounts refer to ranges from 0.1-50mol% with respect to the phosphorous organic compound IIa, IIb or IIc.

The reaction is carried out in an arene solvent such as in benzene, toluene, o-, m- or p-xylene, mesitylene, ethylbenzene, diphenylethane, 1,2,3,4-tetrahydronaphthalene (tetraline), isopropylbenzene (cumol) or in mixtures thereof.

The reaction temperature is preferably above the melting temperature of sodium. It is recommended to stir the reaction mixture.

The reduction is carried out by reacting the intermediate V and/or $(R_1P)_n$, $n \geq 3$ with a proton source like sterically hindered alcohols, trialkylamine hydrohalogenes, bisarylamines, malonic nitrile, malonic acid esters, amidine hydrohalogene and carboxylic acids in the presence of surplus alkali metal from the metallation step whereby a protonated and/or a metallized

- 13 -

phosphane (IId) and a protonated and/or metallized diphosphane (IIe) $R_1-P(H,Me)-P(H,Me)-R_1$ is formed via different intermediary steps as the main component.

R_1 , R_3 , Me, m and n have the meaning cited above,

The amount of the diphosphane (IIe) can be influenced by appropriate addition of the above mentioned catalysts prior, during or after the metallation step. Preferred catalysts are, for example, alkali- or earth alkali hydroxides in amounts of 0.1-10 mol% with respect to the phosphorous organic compound IIa, IIb and IIc. Other preferred catalysts are, for example, Li, Na or K alcoholates, preferably alcoholates of sterically hindered alcohols and most preferably KOH and sterically hindered K-alcoholates in amounts of 5-50 mol% with respect to IIa, IIb and IIc.

In a further embodiment, the process starts with a birch-like reduction of diphosphanes of the formula $(R_1)_2P-P(R_1)_2$ or polyphosphanes of the formula $[R_1P]_n$, wherein R_1 is as defined above and n is ≥ 3 with a metal, preferably sodium, in the presence a proton source like sterically hindered alcohols, trialkylamine hydrohalogenes, bisarylamines, malono nitrile, malonic acid esters, amidine hydrohalogene and carboxylic acids to obtain phosphanes of the formula R_1PH_2 or $(R_1)_2PH$. The phosphanes are then reacted with an acid halide or an electrophilic compound R_3-Hal .

The above diphosphanes of the formula $(R_1)_2P-P(R_1)_2$ or polyphosphanes of the formula $[R_1P]_n$ may be prepared as describes in the Int. Application PCT/EP 03/50873 by reacting $R^1P(Hal)_2$ with an alkali metal or an alkaline-earth metal in an organic solvent such as e.g. in toluene optionally in the presence of an activator such as e.g. N,N,N',N'-tetramethylethylenediamine (TMEDA) or by reacting $R^1P(Hal)_2$ with active zinc in the presence of a solvent.

The reduction step is the essential feature in the above-described novel process, as this step was shown to be largely responsible for the improved selectivity of the whole process.

- 14 -

The reduction step can be carried out in the presence of an activator such as amines (triethylamine, tributylamine, piperidine, morpholine, N-methylpiperidine, N-methyl morpholine) or polyamines such as, for example TMEDA =N,N,N',N'-tetramethylethylenediamine.

It is useful to employ from 1 to 2 equivalents of a proton source like sterically hindered alcohols, trialkylamine hydrohalogenes, bisarylamines, malono nitrile, malonic acid esters, amidine hydrohalogene and carboxylic acids. The solvent is preferably the same as in the metallation step.

The reaction temperatures are preferably in the range from -20°C to +160°C, e.g. from 80°C to 140°C.

The protonated and/or metallized phosphane (II_d) and (II_e) obtained as described above is reacted in the next reaction step with acid halides (III, III', III'', III''') or with electrophilic compounds R₃-Hal to the mono- or bisacylphosphane (I, I', I'', I''').

In addition, it is also possible to directly react the metallized phosphanide (V) or the mixture of (V) with the cyclic phosphanes (R₁P)_n, n ≥ 3, with the acid halides (III, III', III'', III''') or with electrophilic compounds R₃-Hal to the mono- or bisacylphosphane (I, I', I'', I''').

The solvents used may be, for example, the same as those used above for the first step. However, it is also possible to remove the solvent used in the first step by distillation and to take up the residue in another solvent and then to further process it. It is preferred to work in the same solvent as in the preceding step, preferably in xylene or toluene.

It is possible to add polar or dipolar co-solvents to the reaction mixture during or after the reduction step. Such solvents may be linear or cyclic amides like dimethylacetamide (DMA), n-methyl pyrrolidone (NMP), cyclic ureas like 1,3-dimethylpropylene urea (DMPU), linear and cyclic glycols like diglyme and dimethoxyethane (DME).

The reaction temperatures for the reaction with the acid halide are usefully in the range from -20° to +80°C.

- 15 -

The mono- or bisacylphosphane of formula I can be isolated by the customary technological methods which are known to the skilled person, for example by filtration, evaporation or distillation. Likewise, the customary methods of purification may be used, for example crystallisation, distillation or chromatography.

However, the phosphanes can also be reacted without isolation to the corresponding mono- or bisacylphosphane oxides or mono- or bisacylphosphane sulfides.

Using the process of this invention it is also possible to prepare mono- and bisacylphosphanes together in one reaction step.

Depending on the substituents used, unsymmetric compounds may be formed by the novel process.

Monoacylphosphane oxides are compounds of the formula I' corresponding to compounds of the formula I wherein $n=1$ and $m=1$.

The residues R_1 and R_3 may be the same or may be different.

Bisacylphosphane oxides are compounds of the formula I'' corresponding to compounds of the formula I wherein $n=1$ and $m=2$.

The residues R_2 and R_2' may be the same or may be different.

By means of the novel process it is furthermore also possible to prepare mixtures of aliphatic and aromatic monoacylphosphanes or mixtures of aliphatic and aromatic bisacylphosphanes.

If required, all of the mixtures may be separated by the processes customarily used in the technology or they may be further used as they are.

This invention also relates to a process for the preparation of mono- and bisacylphosphane oxides or mono- and bisacylphosphane sulfides. This process is first carried out as described above and a mono- or bisacylphosphane (I) is prepared. The crude reaction product (I) can then be further processed without purification and an additional reaction step may be carried out without isolation of the phosphane (I) using the solution of the crude product. If required, the solvent may be changed, for example, by concentrating the solution containing the mono- or bisacylphosphane and taking up the residue in a new solvent. Of course it is also possible to further react above-described unseparated mixtures of compounds of formula (I) to the corresponding oxide or sulfide.

It is recommended to adjust the p_H of the reaction mixture prior to the oxidation step to a p_H of 2-8, preferably to a p_H of 3-6 by addition of typical inorganic and/or organic acids or buffer systems.

When preparing the respective oxide (IVa), the oxidation of the phosphane (I) is carried out using the oxidant conventionally used in the technology:

Suitable oxidants are in particular hydrogen peroxide and organic peroxy compounds, for example peracetic acid or t-butylhydroperoxide, air or pure oxygen.

The oxidation is usefully carried out in solution. Suitable solvents are aromatic hydrocarbons, such as benzene, toluene, m-xylene, p-xylene, ethylbenzene or mesitylene, or aliphatic hydrocarbons, such as alkanes and alkane mixtures, e.g. petroleum ether, hexane or cyclohexane. During oxidation, the reaction temperature is preferably kept in the range from 0° to 120°C, preferably from 20° and 80°C.

The reaction products (IVa) can be isolated and purified by conventional processing methods known to the skilled person.

The respective sulfide (IVb) is prepared by reaction with sulfur:

The mono- or bisacylphosphanes (I) are in this case reacted in substance or, where appropriate, in a suitable inert organic solvent with an equimolar to 2-fold molar amount of elementary sulfur. Suitable solvents are for example those described for the oxidation reaction. However, it is also possible to use e.g. aliphatic or aromatic ethers, such as dibutyl ether, dioxane, diethylene glycol dimethyl ether or diphenyl ether, in the temperature range from 20° to 250°C, preferably from 60° to 120°C. The resulting mono- or bisacylphosphane sulfide, or its solution, is usefully freed from any remaining elementary sulfur by filtration. After the solvent is removed, the mono- or bisacylphosphane sulfide can be isolated by distillation, chromatography or recrystallisation in pure form.

As mentioned above, it is also possible to use mixtures of compounds of formula I for the oxidation or reaction to the sulfide. The correspondingly obtained oxide or sulfide mixtures can either be separated by processes customarily used in the technology or may be used as mixtures.

All of the above reactions are usefully carried out with exclusion of air in an inert gas atmosphere, e.g. under nitrogen or argon gas. The respective reaction mixture is usefully also stirred.

The acid halides (III, III', III'', III''') or the electrophilic compounds R₃-Hal used as starting materials are known substances, some of which are commercially available, or may be prepared in analogy to known compounds.

The preparation of the phosphorus halides (II) is also described in a great number of publications and can be carried out in analogy to the descriptions provided there. In J. Chem. Soc. (1935), 462 and J. Chem. Soc. (1944), 276, W. Davies discloses for example the preparation of aryl phosphorus chlorides by reaction of arylene with phosphorus trichloride in

- 18 -

the presence of aluminum trichloride. According to F. Nief, Tetrahedron 47 (1991) 33, 667 or Th. Knapp, Tetrahedron 40 (1984) 4, 76, the Grignard reaction of aryl halides with magnesium and phosphorus trichloride is another possibility. According to S. Metzger, J. Org. Chem. 29 (1964), 627, alkylphosphorus chlorides are accessible in the same manner. In Helv. Chim. Act. 36 (1953), 1314, Th. Weil describes the reaction of aryl halides or alkyl halides with magnesium followed by the reaction with zinc chloride and subsequent reaction with phosphorus trichloride. The reaction of aryl halides with butyl lithium and phosphorus trichloride to the corresponding aryl phosphorus chloride is disclosed by G. Whitesides in JACS 96 (1974), 5398. According to Th. Knapp, Tetrahedron 40 (1984) 4, 765, the reaction of the aryl magnesium halide with bis(dimethylamino)phosphorus chloride followed by the reaction with hydrochloric acid also results in the desired starting material. According to A. Burg, US 2934564, the same method may also be used for the preparation of the corresponding alkyl phosphorus chlorides.

It is characteristic of the novel process that the individual processing steps can be carried out directly one after the other without the need for isolating and purifying the respective intermediates.

Mixtures such as those described in the process for the preparation of the corresponding phosphanes may also be formed, or may also be specifically produced, in the above-described process for the preparation of mono- or bisacylphosphane oxides or mono- or bisacylphosphane sulfides. Such mixtures can be separated by methods known in the technology or may be further used in the form of mixtures.

The phosphanes which are accessible by the novel process are important educts for the preparation of the corresponding phosphane oxides and phosphane sulfides. The phosphane oxides and phosphane sulfides are used in the art as initiators in photopolymerisation reactions.

The following examples illustrate the invention in more detail, although it is not intended that the invention be limited to the examples. As in the remaining description and in the patent claims, parts or percentages are by weight, unless otherwise stated.

EXAMPLES

General Solvents are used as received (without any treatment) or dried over molecular sieves or by azeotropic distillation. The course of the reaction is monitored by ^{31}P -NMR spectroscopy.

Example 1 Basic procedure for experiments collected in Tables 1-8: Preparation of bis(2,4,6-trimethylbenzoyl)phenylphosphine oxide using *tert*-butanol as proton source.

formula I''', $\text{R}_1 = \text{phenyl}$, $\text{R}_2, \text{R}_2' = \text{mesityl}$;

a) Metallation of P,P-dichlorophenylphosphine in toluene at 98-110°C

Excluding moisture by an argon atmosphere, sodium lumps (20.61 g, 0.896 mol) are suspended at room temperature in toluene (870 g). This mixture is heated up to reflux with vigorous stirring starting as soon as the temperature reaches 98°C. After formation of a fine sodium suspension P,P-dichlorophenylphosphine (40.10 g, 0.224 mol) is dropwise added over one hour under vigorous stirring. Heating under reflux for an additional 16 h leads to the formation of a yellow precipitate.

b) Protonation / reduction

The yellow suspension is dropwise treated with *tert*-butanol (33.20 g, 0.448 mol) over one hour at 98-110°C. Stirring is continued under reflux until all sodium is used up (ca. one hour).

c) Acylation

To the resulting thin, yellow suspension is added 2,4,6-trimethylbenzoyl chloride (82.12 g, 0.450 mol) at such a rate that the temperature is kept at 35-37°C. The mixture is then stirred for another hour at 35-37°C.

d) Oxidation using 30% H_2O_2 at 40-50°C

To the resulting thin, light yellow suspension is dropwise added 30% hydrogen peroxide (76.16 g, 0.672 mol) at such a rate that the temperature is kept between 40-50°C. Stirring is continued for 2 h at 40-50°C. The light yellow suspension is treated with 250 g of 5% aqueous NaHCO_3 , and then stirred for 5 min at 40-50°C. The two phases are separated and

the organic phase washed with water (2×250 g). After evaporation of toluene, heptane (150 g) is added, the mixture heated up to 80°C and then cooled to room temperature. The resulting solid is collected and washed with heptane (2×60 g). 71.0 g (75.7%) of bis(2,4,6-trimethylbenzoyl)phenylphosphine oxide are obtained as light yellow powder with a melting point of $130\text{-}131^{\circ}\text{C}$.

In the following tables conditions and results of typical experiments are summarized which have been conducted based on the procedure described in Example 1. Variations of conditions in synthetic steps indicated in the header of each table are related to the four steps a)-d) described in Example 1.

Abbreviations Conc.: concentration [mol PhPCl_2 / total weight (in kg) of metallation reaction]; TMBCl = 1,3,5-trimethylbenzoyl chloride; Equivalents (eq.) of reagents (Na, etc.) are related to the amount of PhPCl_2 (mol) used.

General Yields of bis(2,4,6-trimethylbenzoyl)-phenylphosphine oxide given in Table 2-8 have been calculated from the $^1\text{H-NMR}$ spectra of the crude isolated product material. In some cases yields have been further confirmed by the isolation of pure bis(2,4,6-trimethylbenzoyl)-phenylphosphine oxide product *via* recrystallization from heptane or *flash* chromatography.

Table 1 Variation of conditions in the metallation step [see Example 1, a): reaction of PhPCl_2 with sodium metal]. No alcohol used.

a) Additive has been added prior to the reduction/protonation step.

- 28 -

- b) Additive has been added after the reduction/protonation step, followed by additional heating of the reaction mixture.
- c) Metallation reaction has been catalyzed by the addition of 0.02 equiv. of alcohol.
- d) Prior to the oxidation reaction the pH has been adjusted to four.
- e) The protonation/reduction step has been performed at 150°C.
- f) Yield not determined.
- g) Yield of pure bis(2,4,6-trimethylbenzoyl)phenylphosphine oxide after purification by *flash* chromatography.

Table 7 Variation of conditions in acylation step:Alcohol 1: *tert*-butanol;

Alcohol 2: 3-methyl-3-pentanol.

Entry	Solvent	Conc. [mol/kg]	Na [eq.]	Alcohol [eq.]	Acylation Step

a) Conc. = 0.7 mol/kg.

b) 4.15 eq. Na – addition of 0.5 eq. Li after the protonation/reduction step.

c) 4.15 eq. Na – addition of 0.3 eq. Li after the protonation/reduction step.

d) pH has been adjusted after the acylation reaction to the given value by the addition of 1M HCl solution.

Example 2 Preparation of bis(2,4,6-trimethylbenzoyl)phenylphosphine oxide using TMEDA, and *tert*-butanol as proton source.

a) Metallation of P,P-dichlorophenylphosphine

Excluding moisture by an argon atmosphere, sodium lumps (20.61 g, 0.896 mol) are suspended at room temperature in a mixture of toluene (870 g) and TMEDA (N,N,N',N'-tetra-

- 30 -

methylethylenediamine) (31.23 g, 0.268 mol). This mixture is heated up to reflux with vigorous stirring starting as soon as the temperature reaches 98°C. After formation of a fine sodium suspension P,P-dichlorophenylphosphine (40.10 g, 0.224 mol) is dropwise added over one hour under vigorous stirring. Heating under reflux for an additional 22 h leads to a yellow precipitate.

b) Protonation / reduction

The yellow suspension is dropwise treated with *tert*-butanol (33.20 g, 0.448 mol) over one hour at 98-110°C. Stirring is continued under reflux until all of the sodium is used up.

c) Acylation and neutralisation of TMEDA

To the resulting thin, yellow suspension is added 2,4,6-trimethylbenzoyl chloride (82.12 g, 0.450 mol) at such a rate that the temperature is kept at 35-37°C. The mixture is then stirred for another hour at 35-37°C.

Concentrated H₂SO₄ (27.46 g, 0.270 mol) is dropwise added at room temperature under vigorous stirring at such a rate that the temperature is kept below 40°C. Stirring is continued at room temperature for 10 min.

d) Oxidation using 30% H₂O₂ at 40-50°C

To the resulting, thin, light yellow suspension is dropwise added 30% hydrogen peroxide (76.16 g, 0.672 mol) at such a rate that the temperature is kept at 40-50°C. Stirring is continued for 1-2 h at 40-50°C. The light yellow suspension is treated with 250 g of 5% aqueous NaHCO₃, and then stirred for 5 min at 40-50°C. The phases are separated and the organic phase washed with water (2 × 250 g). After evaporation of toluene, heptane (150 g) is added, the mixture heated up to 80°C and then cooled to room temperature. The resulting solid is collected and washed with heptane (2 × 60 g). 70.4 g (75%) of bis(2,4,6-trimethylbenzoyl)phenylphosphine oxide are obtained as light yellow powder with a melting point of 130-131°C.

Example 3 Preparation of bis(2,4,6-trimethylbenzoyl)phenylphosphine oxide using catalytic amounts of sodium hydroxide during metallation, and *tert*-butanol as proton source.

a) Metallation of P,P-dichlorophenylphosphine in toluene at 98-110°C

- 31 -

Excluding moisture by an argon atmosphere, sodium lumps (21.85 g, 0.940 mol) are suspended at room temperature in toluene (430 g), together with sodium hydroxide (0.09 g). This mixture is heated up to reflux with vigorous stirring starting as soon as the temperature reaches 98°C. After formation of a fine sodium suspension P,P-dichlorophenylphosphine (41.80 g, 0.224 mol) is dropwise added over 4 h under vigorous stirring. Heating is continued under reflux for ca. 5 h until all P,P-dichlorophenylphosphine has reacted (check by ^{31}P -NMR).

b) Protonation / reduction

The resulting greenish grey suspension is dropwise treated with *tert*-butanol (33.40 g, 0.448 mol) over 40 min at 98-110°C. Stirring is continued under reflux until all sodium is used up (ca. one hour).

c) Acylation

To the resulting thin, yellow suspension is added 2,4,6-trimethylbenzoyl chloride (82.53 g, 0.448 mol) at such a rate that the temperature is kept at 35-37°C. The mixture is then stirred for another hour at 35-37°C.

d) Oxidation using 30% H_2O_2 at 40-50°C

To the resulting thin, yellow-orange suspension is dropwise added 30% hydrogen peroxide (30.50 g, 0.268 mol) at such a rate that the temperature is kept between 75-80°C. Stirring is continued for 1-2 h at 80°C. The light yellow suspension is treated with 150 g of 1% aqueous NaHCO_3 , and then stirred for 15 min at 65-70°C. The two phases are separated and the organic phase washed with water (3 × 80 g). After evaporation of toluene, heptane (150 g) is added, the mixture heated up to 98°C, stirred during 15 min, and then cooled to room temperature. The resulting solid is collected and washed with heptane (2 × 60 g). 73.8 g (78%) of bis(2,4,6-trimethylbenzoyl)phenylphosphine oxide are obtained as light yellow powder with a melting point of 130-131°C.

Example 4 Preparation of bis(2,4,6-trimethylbenzoyl)phenylphosphine oxide using catalytic amounts of 3-methyl-3-pentanol during metallation, and 3-methyl-3-pentanol as proton source.

a) Metallation of P,P-dichlorophenylphosphine in toluene at 98-110°C

- 32 -

Excluding moisture by an argon atmosphere, sodium lumps (23.40 g, 1.008 mol) are suspended at room temperature in toluene (280 g), together with 3-methyl-3-pentanol (0.26 g). This mixture is heated up to reflux with vigorous stirring starting as soon as the temperature reaches 98°C. After formation of a fine sodium suspension P,P-dichlorophenylphosphine (44.50 g, 0.246 mol) is dropwise added over 4.5 h under vigorous stirring. Heating is continued under reflux for ca. 1 h until all P,P-dichlorophenylphosphine has reacted (check by ^{31}P -NMR).

b) Protonation / reduction

The resulting greenish grey suspension is dropwise treated with 3-methyl-3-pentanol (53.60 g, 0.514 mol) over 40 min at 98-110°C. Stirring is continued under reflux until all sodium is used up (ca. one hour).

c) Acylation

To the resulting thin, yellow suspension is added 2,4,6-trimethylbenzoyl chloride (91.62 g, 0.492 mol) at such a rate that the temperature is kept at 35-37°C. The mixture is then stirred for another hour at 35-37°C.

d) Oxidation using 30% H_2O_2 at 40-50°C

To the resulting thin, yellow-orange suspension is first dropwise added H_2O (125 g) at room temperature during 10 min. The reaction mixture is heated up to 60°C followed by the addition of 30% hydrogen peroxide (30.62 g, 0.270 mol) at such a rate that the temperature is kept between 75-80°C. Stirring is continued for 30 min at 80°C and the aqueous phase separated at 50°C. The light yellow suspension is treated with 77 g of 1% aqueous NaHCO_3 , and then stirred for 5 min at 40-50°C. The two phases are separated and the organic phase washed with water (3 × 36 g). After evaporation of toluene and 3-methyl-3-pentanol, heptane (132 g) is added, the mixture heated up to 80°C, stirred during 15 min, and then slowly cooled to room temperature. The resulting solid is collected and washed with heptane (2 × 25 g). 77.6 g (75.4%) of bis(2,4,6-trimethylbenzoyl)phenylphosphine oxide are obtained as light yellow powder with a melting point of 130-131°C.

- 33 -

Example 5 Preparation of bis(2,4,6-trimethylbenzoyl)phenylphosphine oxide using catalytic amounts of potassium *tert*-butoxide during metallation, and 3-methyl-3-pentanol as proton source.

a) Metallation of P,P-dichlorophenylphosphine in toluene at 98-110°C

Excluding moisture by an argon atmosphere, sodium lumps (22.66 g, 0.984 mol) are suspended at room temperature in toluene (280 g), together with potassium *tert*-butoxide (2.77 g, 0.024 mol). This mixture is heated up to reflux with vigorous stirring starting as soon as the temperature reaches 98°C. After formation of a fine sodium suspension P,P-dichlorophenylphosphine (44.50 g, 0.246 mol) is dropwise added over 9 h under vigorous stirring. Heating is continued under reflux for 15 min until all P,P-dichlorophenylphosphine has reacted (check by ^{31}P -NMR).

b) Protonation / reduction

The resulting yellow suspension is dropwise treated with 3-methyl-3-pentanol (51.29 g, 0.492 mol) over 1 h at 98-110°C. Stirring is continued under reflux until all sodium is used up (ca. one hour).

c) Acylation

To the resulting thin, yellow suspension is added 2,4,6-trimethylbenzoyl chloride (91.62 g, 0.492 mol) at such a rate that the temperature is kept at 35-37°C. The mixture is then stirred for another hour at 35-37°C.

d) Oxidation using 30% H_2O_2 at 40-50°C

To the resulting thin, yellow-orange suspension is dropwise added H_2O (125 g) at room temperature during 10 min. The reaction mixture is heated up to 60°C followed by the addition of 30% hydrogen peroxide (30.62 g, 0.270 mol) at such a rate that the temperature is kept between 75-80°C. Stirring is continued for 2 h at 80°C followed by the separation of the aqueous phase at 50°C. The resulting light yellow organic phase is stirred together with 77 g of 1% aqueous NaHCO_3 for 5 min at 40-50°C. The two phases are separated and the organic phase washed with water (3 × 36 g). After evaporation of toluene and 3-methyl-3-pentanol, heptane (132 g) is added, the mixture heated up to 80°C, stirred during 15 min, and then slowly cooled to room temperature. The resulting solid is collected and washed with heptane (2 × 25 g). 80.3 g (78%) of bis(2,4,6-trimethylbenzoyl)phenylphosphine oxide are obtained as light yellow powder with a melting point of 130-131°C.

Example 6 Preparation of bis(2,4,6-trimethylbenzoyl)phenylphosphine oxide using catalytic amounts of potassium *tert*-butoxide during metallation, and 3-methyl-3-pentanol as proton source.

a) Metallation of P,P-dichlorophenylphosphine in toluene at 110°C

Excluding moisture by an argon atmosphere, potassium *tert*-butoxide (2.84 g, 24.6 mmol) is shortly stirred together with toluene (280 g) at room temperature. Stirring is stopped, and small sodium lumps (23.51 g, 1.021 mol) are added. The reaction mixture is heated up to 105°C without stirring and kept at this temperature until all sodium is molten. Vigorous stirring is then started and continued until a fine sodium suspension is formed. P,P-dichlorophenylphosphine (44.47 g, 0.246 mol) is dropwise added to the suspension over 9 h at 110°C under vigorous stirring. Heating is continued for 15 min until all P,P-dichlorophenylphosphine has reacted (check by ^{31}P -NMR).

b) Protonation / reduction

The resulting yellow suspension is dropwise treated with 3-methyl-3-pentanol (55.14 g, 0.529 mol) over 4 h at 110°C. Stirring is continued at 110°C until all sodium is used up (ca. 15 min).

c) Acylation

To the resulting light yellow suspension is added 2,4,6-trimethylbenzoyl chloride (91.7 g, 0.492 mol) over 3 h at a temperature of 35-37°C. The mixture is then stirred for another hour at 35-37°C.

d) Oxidation using 30% H_2O_2 at 40-50°C

To the resulting thin, yellow suspension is dropwise added H_2O (155 g) at 35-37°C during 30 min. The aqueous phase is then separated from the reaction mixture followed by treatment with an additional amount of H_2O (45 g). After stirring for 5 min at 35-37°C the reaction mixture is heated up to 60°C followed by the addition of 30% hydrogen peroxide (27.86 g, 0.246 mol) during 2 h at such a rate that the temperature is kept between 78-82°C. Stirring is continued for 2 h at 78-82°C followed by the separation of the aqueous phase at 65-70°C. The resulting light yellow organic phase is washed with water (3 × 36 g) at 65-70°C. After evaporation of toluene and 3-methyl-3-pentanol, heptane (100 g) is added under stirring during one hour at 78-82°C, and the mixture slowly cooled to room temperature under

- 35 -

stirring. The resulting solid is collected and washed with heptane (2×25 g). 80 g (78%) of bis(2,4,6-trimethylbenzoyl)phenylphosphine oxide are obtained as light yellow powder with a melting point of 130-131°C.

Example 7 Preparation of bis(2,4,6-trimethylbenzoyl)phenylphosphine oxide using catalytic amounts of potassium hydroxide together with 3-methyl-3-pentanol during metallation, and 3-methyl-3-pentanol as proton source.

a) Metallation of P,P-dichlorophenylphosphine in toluene at 98-110°C

Excluding moisture by an argon atmosphere, sodium lumps (22.85 g, 0.984 mol) are suspended at room temperature in toluene (280 g), together with potassium hydroxide (1.61 g, 24.6 mmol) and 3-methyl-3-pentanol (2.54 g, 24.6 mmol). This mixture is heated up to reflux with vigorous stirring starting as soon as the temperature reaches 98°C. After formation of a fine sodium suspension P,P-dichlorophenylphosphine (44.93 g, 0.246 mol) is dropwise added over 2 h under vigorous stirring. Heating is continued under reflux for 1 h until all P,P-dichlorophenylphosphine has reacted (check by ^{31}P -NMR).

b) Protonation / reduction

The resulting orange suspension is dropwise treated with 3-methyl-3-pentanol (50.78 g, 0.492 mol) over 1 h at 98-110°C. Stirring is continued under reflux until all sodium is used up (ca. one hour).

c) Acylation

To the resulting thin, yellow suspension is added 2,4,6-trimethylbenzoyl chloride (91.62 g, 0.492 mol) at such a rate that the temperature is kept at 35-37°C. The mixture is then stirred for another hour at 35-37°C.

d) Oxidation using 30% H_2O_2 at 40-50°C

To the resulting thin, yellow-orange suspension is dropwise added H_2O (125 g) at room temperature during 10 min. The reaction mixture is treated with 30% hydrogen peroxide (41.83 g, 0.369 mol) at such a rate that the temperature is kept between 40-50°C. Stirring is continued for 1 h at 70°C and the aqueous phase separated at room temperature. The resulting light yellow suspension is washed with 150 ml of 5% aqueous NaHCO_3 , and twice with 100 ml of H_2O . The combined aqueous phases are extracted with toluene (100 ml).

- 36 -

Drying of the combined organic phases over Na_2SO_4 , evaporation of toluene and 3-methyl-3-pentanol provides a yellow solid (98.0 g). Heptane (132 g) is added, the mixture heated up to 80°C , stirred during 15 min, and then slowly cooled to room temperature. The resulting solid is collected and washed with heptane (2×40 g). 79.3 g (77%) of bis(2,4,6-trimethylbenzoyl)-phenylphosphine oxide are obtained as light yellow powder with a melting point of 130 - 131°C .

Example 8 Preparation of bis(2,4,6-trimethylbenzoyl)phenylphosphine oxide using catalytic amounts of potassium during metallation, and 3-methyl-3-pentanol as proton source.

a) Metallation of P,P-dichlorophenylphosphine in toluene at 98 - 110°C

Excluding moisture by an argon atmosphere, sodium lumps (22.60 g, 0.984 mol) and potassium lumps (0.96 g, 24.6 mmol) are suspended at room temperature in toluene (280 g), together with 3-methyl-3-pentanol (0.25 g, 2.46 mmol). This mixture is heated up to reflux with vigorous stirring starting as soon as the temperature reaches 98°C . After formation of a fine sodium/potassium suspension P,P-dichlorophenylphosphine (44.50 g, 0.246 mol) is dropwise added over 4 h under vigorous stirring. Heating is continued under reflux for ca. 2 h until all of P,P-dichlorophenylphosphine has reacted (check by ^{31}P -NMR).

Steps b)-d) have been performed as described in Example 4.

Example 9 Preparation of bis(2,4,6-trimethylbenzoyl)phenylphosphine oxide with partial removal of 3-methyl-3-pentanol during the acylation step.

a) Metallation of P,P-dichlorophenylphosphine in toluene at 98 - 110°C

Excluding moisture by an argon atmosphere, sodium lumps (22.99 g, 0.984 mol), three times washed with toluene, are suspended at room temperature in toluene (280 g), together with potassium *tert*-butoxide (2.77 g, 0.024 mol). This mixture is heated up to reflux with vigorous stirring starting as soon as the temperature reaches 100°C . After formation of a fine sodium suspension, P,P-dichlorophenylphosphine (44.50 g, 0.246 mol) is dropwise added over 3-4 h under vigorous stirring. Heating is continued under reflux for 1 h 15 min until all P,P-dichlorophenylphosphine has reacted (check by ^{31}P -NMR).

- 37 -

b) Protonation / reduction

The resulting yellow suspension is dropwise treated with 3-methyl-3-pentanol (51.29 g, 0.492 mol) over 1 h 15 min at 98-110°C. Stirring is continued under reflux until all sodium is used up (1 h 30 min). The resulting thin, yellow suspension is kept at room temperature under argon overnight.

c) Acylation

2,4,6-trimethylbenzoyl chloride (45.81 g, 0.246 mol) is added dropwise to the yellow suspension at such a rate that the temperature is kept at 35-37°C (50 min). The following procedure is now repeated five times: a) addition of toluene, b) distillation of a mixture of toluene/3-methyl-3-pentanol from the reaction mixture under reduced pressure (280 mbar) at 65-75°C (total amount of toluene added: 830 ml; total amount of liquid removed: 830 ml). Another equivalent of 2,4,6-trimethylbenzoyl chloride (45.81 g, 0.246 mol) is now added dropwise to the yellow suspension at such a rate that the temperature is kept at 35-37°C (2 h 20 min). The mixture is then stirred for an additional 35 min at 35-37°C.

d) Oxidation using 30% H₂O₂ at 40-50°C

To the resulting thin, yellow-orange suspension is dropwise added H₂O (125 g) at room temperature during 5 min. The reaction mixture is heated up to 60°C followed by the addition of 30% hydrogen peroxide (41.9 g, 0.370 mol) at such a rate that the temperature is kept between 75-80°C. Stirring is continued for 1 h 15 min at 70°C. The reaction mixture is extracted once with 150 ml 5% NaHCO₃ and two times with 150 ml water. Drying of the organic layer over Na₂SO₄ and evaporation provides a yellowish oil (103 g). The crude material is crystallized from heptane (132 ml), providing 80.5 g (77%) of bis(2,4,6-trimethylbenzoyl)phenylphosphine oxide as light yellow powder.

Example 10 Preparation of bis(2,4,6-trimethylbenzoyl)-2,4-dipentoxyphenylphosphine oxide.

- 38 -

formula I''', $R_1 = 2,4\text{-dipentoxyphenyl}$, $R_2, R_2' = \text{mesityl}$;

a) Metallation of P,P-dichloro-2,4-dipentoxyphenylphosphine in toluene at 98-110°C

Excluding moisture by an argon atmosphere, sodium lumps (3.1 g, 135 mmol), three times washed with toluene, are suspended at room temperature in toluene (130 ml), together with potassium *tert*-butoxide (0.39 g, 34.0 mmol). This mixture is heated up to reflux with vigorous stirring starting as soon as the temperature reaches 100°C. After formation of a fine sodium suspension, P,P-dichloro-2,4-dipentoxyphenylphosphine (11.87 g, 34.0 mmol) dissolved in 20 ml toluene is added dropwise over 3-4 h under vigorous stirring. Heating is continued under reflux for 17 h.

b) Protonation / reduction

The resulting dark violet suspension is dropwise treated with 3-methyl-3-pentanol (6.91 g, 68 mmol) over one hour at 98-110°C. Stirring is continued under reflux until all sodium is used up (24 h).

c) Acylation

To the resulting grey/black suspension is added 2,4,6-trimethylbenzoyl chloride (12.34 g, 68 mmol) at such a rate that the temperature is kept at 35-37°C. The mixture is then stirred for another hour at 35-37°C.

d) Oxidation using 30% H_2O_2 at 40-50°C

To the resulting green/black suspension is dropwise added H_2O (10 g) at 50°C within 5 min. The reaction mixture is kept at 50-60°C followed by the addition of 30% hydrogen peroxide (5.73 g, 51 mmol) at such a rate that the temperature is kept between 50-60°C. Stirring is continued for one hour at 50-60°C. The reaction mixture is extracted once with 5% aqueous $NaHCO_3$ and water. Drying of the organic phase over Na_2SO_4 and evaporation provides 24.0 g of a yellowish oil. One gram of crude material is purified by preparative liquid

- 39 -

chromatography (heptane/ethyl acetate 60 : 40). After evaporation 230 mg of bis(2,4,6-trimethylbenzoyl)-2,4-dipentoxyphenylphosphine oxide are obtained as a yellow oil. The calculated overall yield of the title product is 28%.

Example 11

I) Preparation of pentaphenylcyclopentaphosphane (PhP)₅.

(PhP)₅ has been prepared as described in the Int. Patent Application PCT/EP 03/50873 by suspending sodium pieces in a mixture of toluene / TMEDA and adding P,P-dichlorophenylphosphine.

II) Preparation of bis(2,4,6-trimethylbenzoyl)phenylphosphine oxide from pentaphenylcyclopentaphosphane (PhP)₅, with *tert*-butanol as proton source.

a) Metallation and protonation of pentaphenylcyclopentaphosphane (PhP)₅

Excluding moisture by an argon atmosphere, (PhP)₅ (0.26 g, 0.48 mmol) is dissolved in 30 ml of dry toluene. Sodium lumps (0.11 g, 4.8 mmol) are added at room temperature and the mixture is heated up to reflux with vigorous stirring starting as soon as the sodium is melted. The resulting suspension is treated with *tert*-butanol (0.356 g, 4.8 mmol) at 98-110°C. Stirring is continued under reflux until all of the (PhP)₅ is used up and PhPH₂ is formed.

Acylation and oxidation have been performed as described in Example 1.

Example 12

I) Preparation of disodium (diphenyldiphosphanediide) of formula [Na(dme)₃]⁺[Na₅(P₂Ph₂)₃(dme)₃]⁻.

Disodium (diphenyldiphosphanediide) of the formula [Na(dme)₃]⁺[Na₅(P₂Ph₂)₃(dme)₃]⁻ has been prepared as described in the Int. Patent Application PCT/EP 03/50873 by suspending sodium pieces in a mixture of toluene / DME and adding P,P-dichlorophenylphosphine.

II) Acylation of [Na(dme)₃]⁺[Na₅(P₂Ph₂)₃(dme)₃]⁻.

Crystalline [Na(dme)₃]⁺[Na₅(P₂Ph₂)₃(dme)₃]⁻ (3 g) is suspended in toluene (20 mL) and 2,4,6-trimethylbenzoyl chloride (1.5 fold excess) is added such that the reaction temperature does not rise above 40°C. The immediate precipitation of NaCl is observed. The slightly yellow colored solution contains about 60 mol% of acylated products and 40 mol% of cyclo-

- 40 -

oligophosphanes. The fraction of the acylated products is composed of approximately 60 mol% $\text{PhP}(\text{COMes})_2$, 30 mol% of $\text{Ph}_2\text{P}_2(\text{COMes})_2$ and 10 mol% of the (*E,Z*)-isomers of $(\text{PhPCOMes})^-$ in a molar ratio of 2:1. The fraction of the cyclophosphanes consists of 85 mol% $(\text{PhP})_3$ and 15 mol% $(\text{PhP})_4$.

Example 13 Preparation of bis(2,4,6-trimethylbenzoyl)phenylphosphane oxide without a proton source.

a) Metallation of P,P-dichlorophenylphosphine

Excluding moisture by an argon atmosphere, sodium lumps (2.58 g, 112 mmol) are suspended at room temperature in a mixture of toluene (17.4 g) and TMEDA (N,N,N',N'-tetramethylethylenediamine) (1.62 g, 14.0 mmol). This mixture is heated up to reflux with vigorous stirring starting as soon as the sodium is melted. After formation of a fine sodium suspension, P,P-dichlorophenylphosphine (5 g, 28 mmol) is added dropwise over one hour under vigorous stirring. Heating under reflux for an additional 2.5 h leads to a green/yellow suspension.

b) Acylation

To the resulting thin, green/yellow suspension is added 2,4,6-trimethylbenzoyl chloride (10.2 g, 56 mmol) at 0-10°C. The mixture is then stirred for another 1.5 hour at 0-10°C.

c) Oxidation using H_2O_2 at 80°C

30% hydrogen peroxide (6.0 g, 53 mmol) is added dropwise to the resulting suspension at room temperature. The mixture is heated up to 80°C and stirring is continued for 1-2 h. The light yellow suspension is washed with water (2 × 50 g). After evaporation of toluene, heptane (35 g) is added, the mixture heated up to 80°C and then cooled to room temperature. The resulting solid is collected and washed with heptane (2 × 15 g). 3.75 g (32%) of bis(2,4,6-trimethylbenzoyl)phenylphosphane oxide are obtained as light yellow powder with a melting point of 130-131°C.

Example 14 Preparation of bis(2,4,6-trimethylbenzoyl)phenylphosphine oxide starting from P,P-dichlorophenylphosphine oxide.

a) Metallation of P,P-dichlorophenylphosphine oxide

- 41 -

Excluding moisture by an argon atmosphere, sodium lumps (2.3 g, 0.10 mol) are suspended at room temperature in a mixture of xylene (50 ml) and TMEDA (N,N,N',N'-tetramethylethylenediamine) (1.47 g, 12.5 mmol). This mixture is heated up to 105-110°C with vigorous stirring starting as soon as the sodium is melted. After formation of a fine sodium suspension, P,P-dichlorophenylphosphine oxide (4.87 g, 25.0 mmol) is added dropwise over 10 min under vigorous stirring. Heating under reflux for an additional 23 h leads to a yellow precipitate.

b) Acylation

To the resulting yellow suspension is added 2,4,6-trimethylbenzoyl chloride (9.13 g, 50 mmol) at 5°C over 20 min. The mixture is then stirred for another 2 h at 30°C.

c) Oxidation with hydrogen peroxide has been performed as described in Example 1.

Example 15 Preparation of (E,Z)-sodium-phenylphospha-2,4,6-trimethylbenzoylenolate.

a) Metallation of P,P-dichlorophenylphosphine in toluene at 98-110°C

Excluding moisture by an argon atmosphere, sodium lumps (6.78 g, 0.295 mol) are suspended at room temperature in toluene (100 ml), together with potassium *tert*-butoxide (827 mg, 7.37 mmol). This mixture is heated up to reflux with vigorous stirring starting as soon as the temperature reaches 98°C. After formation of a fine sodium suspension P,P-dichlorophenylphosphine (13.2 g, 73.7 mmol) is added during 2 h under vigorous stirring. During the addition, the color of the reaction mixture changed from yellow, to orange, to light yellow and then to gray. Heating is continued under reflux for 6 h until all P,P-dichlorophenylphosphine has reacted (check by ^{31}P -NMR).

b) Protonation / reduction

- 42 -

The resulting green-yellow suspension is dropwise treated with *tert*-butanol (14 ml) in toluene (10 ml) over 3 h at 98-110°C. Stirring is continued under reflux for 2 h.

c) Acylation

To the resulting light yellow suspension is dropwise added 2,4,6-trimethylbenzoyl chloride (12.11 g, 66.3 mmol, 0.9 eq.) at room temperature. The suspension is filtered, washed with toluene (10 ml), and the volume of the filtrate reduced to half by solvent evaporation. A light yellow solid precipitated overnight at -18°C. The solid is separated, washed with hexane (20 ml) and then dried under high vacuum for 12 h, giving 9.13 g product. Additional 3.72 g product is isolated from the filtrate by repeated precipitation. According to ¹H-NMR the product consists of a mixture of (*Z*)-enolate/(*E*)-enolate/*tert*-butanol 2:1:2 (the (*Z*)-enolate is tentatively assigned as major isomer).

M.p. (dec.) = 156°C. ³¹P-NMR(*d*₈-THF): δ = 79.9, 56.2* (* = main signal).

¹H-NMR (*d*₈-THF; * = minor isomer, tentatively assigned as (*E*)-enolate; ** = signals corresponding to *tert*-butanol): δ = 7.82 (m, 2 H, C_{Ph}-H); 7.03 (m, 2 H, C_{Ph}-H); 6.92 (m, 2 H*, C_{Ph}-H); 6.89 (m, 2 H*, C_{Ph}-H); 6.86 (m, 1 H, C_{Ph}-H); 6.70 (m, 1 H*, C_{Ph}-H); 6.67 (s, 2 H, C_{Mes}-H); 6.58 (s, 2 H*, C_{Mes}-H); 3.26 (s, 1 H**, ^tBuOH); 2.42 (s, 6 H, Mes o-CH₃); 2.21 (s, 6 H*, Mes o-CH₃); 2.18 (s, 3 H, Mes p-CH₃); 2.12 (s, 3 H*, Mes p-CH₃); 1.14 (s, 9 H**, ^tBu CH₃).

Example 16 Preparation of 2,4,6-trimethylbenzoyl-2,6-dimethoxybenzoyl-phenyl-phosphine oxide.

- 43 -

formula I''', R_1 = phenyl, R_2 = mesityl, R_2' = 2,6-dimethoxy;

a) Metallation of P,P-dichlorophenylphosphine in toluene at 98-110°C

Excluding moisture by an argon atmosphere, sodium lumps (6.28 g, 0.270 mol) are suspended at room temperature in toluene (150 ml), together with potassium *tert*-butoxide (782 mg, 6.76 mmol). This mixture is heated up to reflux with vigorous stirring starting as soon as the temperature reaches 98°C. After formation of a fine sodium suspension P,P-dichlorophenylphosphine (12.10 g, 67.6 mmol) is dropwise added over 2 h under vigorous stirring. Heating is continued under reflux for 3 h until all P,P-dichlorophenylphosphine has reacted (check by ^{31}P -NMR).

b) Protonation / reduction

The resulting yellow suspension is dropwise treated with 3-methyl-3-pentanol (13.95 g, 135.2 mmol) over 35 min at 98-110°C. Stirring is continued under reflux until all sodium is used up (ca. 1.5 h).

c) Acylation

To the resulting thin, yellow suspension is added 2,4,6-trimethylbenzoyl chloride (10.45 g, 56.1 mmol) in toluene (20 ml) at such a rate that the temperature is kept at 35-37°C. The mixture is then stirred for 1 h 30 min at 35-37°C. 2,6-dimethoxybenzoyl chloride (12.51 g, 56.1 mmol) in toluene (20 ml) is added at room temperature within 10 min and stirring is continued for 1 h 30 min.

d) Oxidation using 30% H_2O_2 at room temperature

To the resulting thin, yellow-orange suspension is first dropwise added aqueous 2 M HCl (7 ml) at room temperature. Afterwards, 30% hydrogen peroxide (76.16 g, 0.672 mol) is added at such a rate that the temperature is kept below 35°C. Stirring is continued for 2 h at room temperature. The light yellow suspension is first washed with 42 g of 5% aqueous NaHCO_3 , and then with water (2×60 ml), and the aqueous phases reextracted with toluene (60 ml). The combined organic phases are dried over MgSO_4 and concentrated under vacuum providing a yellow solid. Crystallization (hexane/acetone 2:1) gives 13.4 g (46%) of 2,4,6-trimethylbenzoyl-2,6-dimethoxybenzoyl-phenylphosphine oxide as light yellow solid.

^{31}P -NMR (C_6D_6): δ = 4.6.

^1H -NMR (C_6D_6): δ = 8.45-8.51 (m, 2 H); 7.15-7.20 (m, 3 H); 7.02 (t, 1 H); 6.66 (s, 2 H); 6.14 (d, 2 H); 3.18 (s, 6 H); 2.44 (s, 6 H); 2.09 (s, 3 H).

Example 17 Preparation of 2,4,6-trimethylbenzoyl-pivaloyl-phenylphosphine oxide.

formula I''', R_1 = phenyl, R_2 = mesityl, R_2' = *tert*-butyl;

a) metallation of P,P-dichlorophenylphosphine

Excluding moisture by an argon atmosphere, sodium pieces (2.07 g, 90.3 mmol) are suspended at room temperature in a mixture of toluene (100 ml) and TMEDA (N,N,N',N'-tetramethylethylenediamine) (4 ml). This mixture is heated under reflux and under vigorous stirring. P,P-dichlorophenylphosphane (4.02 g, 22.4 mmol) is added and the suspension is heated under reflux for 5 h until a yellow precipitate is formed.

b) protonation/reduction

Excluding moisture by an argon atmosphere, *tert*-butanol (3.32 g, 44.8 mmol) is added at 100°C over one hour leading to dissolution of the yellow precipitate. The resulting yellow suspension is further stirred under reflux until all sodium is used up.

c) Acylation and neutralisation of TMEDA

To the yellow suspension is added dropwise under stirring 2,4,6-trimethylbenzoyl chloride (4.09 g, 22.4 mmol) in toluene (15 ml). The reaction temperature is kept at room temperature. The mixture is then stirred for another two hours at room temperature. Pivaloylchloride (2,2 -dimethylpropionyl chloride) (2.71 g, 22.4 mmol) is added dropwise under stirring at room temperature. Concentrated H_2SO_4 (1.48 ml, 26.7 mmol) is added dropwise at a temperature below 45°C.

d) Oxidation

To the resulting suspension is added 30% hydrogen peroxide (6.9 ml, 67.6 mmol) under stirring at such a rate that the temperature does not rise above 55°C. Stirring is continued at 40-50°C for one hour followed by the addition of water (10 ml). The organic phase is separated, washed twice with water and with 10% $NaHCO_3$, and then dried over Na_2SO_4 . Evaporation yields a yellow oil which is taken up in 30 ml of petroleum ether (40/70) /

- 45 -

ethylacetate (9:1). After filtration the title compound is obtained as a yellow solid (5.1 g, 64%) with a melting point of 110-112°C.

$^{31}\text{P}\{^1\text{H}\}$ -NMR (CDCl_3): $\delta = 10.0$ (t, $^3J_{\text{PH}} = 9.85$ Hz).

^1H -NMR (CDCl_3): $\delta = 7.88$ (m, 2 H, Ph $H^{(2,6)}$); 7.53 (m, 1 H, Ph $H^{(4)}$); 7.43 (m, 2 H, Ph $H^{(3,5)}$); 6.78 (s, 2 H, Mes H_{ar}); 2.24 (s, 3 H, $p\text{-CH}_3$); 2.18 (s, 6 H, $o\text{-CH}_3$); 1.27 (s, 9 H, ^tBu).

Example 18 Preparation of 2,4,6-trimethylbenzoyl-2,6-dimethoxybenzoyl-2,4-dipentoxyphenylphosphine oxide.

formula I''', $R_1 = 2,4\text{-dipentoxyphenyl}$, $R_2 = \text{mesityl}$; $R_2' = 2,6\text{-dimethoxyphenyl}$

a) Metallation of P,P-dichloro-2,4-dipentoxyphenylphosphine in toluene at 98-110°C

Excluding moisture by an argon atmosphere, sodium lumps (1.55 g, 67.6 mmol), three times washed with toluene, are suspended at room temperature in toluene (70 ml), together with potassium hydroxide (powdered) (0.1 g, 1.7 mmol). This mixture is heated up to reflux with vigorous stirring starting as soon as the temperature reaches 100°C. After formation of a fine sodium suspension, P,P-dichloro-2,4-dipentoxyphenylphosphine (6.6 g, 16.9 mmol) dissolved in 10 ml toluene is added dropwise over 3-4 h under vigorous stirring. Heating is continued under reflux for 1 h 40 min.

b) Protonation / reduction

The resulting dark violet suspension is dropwise treated with 3-methyl-3-pentanol (3.48 g, 33.8 mmol) over 40 min at 95-110°C. Stirring is continued under reflux until all sodium is used up (24 h).

c) Acylation

To the resulting gray suspension is added 2,4,6-trimethylbenzoyl chloride (1.59 g, 8.7 mmol), at such a rate that the temperature is kept at 35-40°C (^{31}P -NMR spectra shows no more signal for PhPH_2). The mixture is then stirred for another 2 h 30 min at 35-40°C. 2,6-Di-

- 46 -

methoxybenzoyl chloride [1.94 g, 8.7 mmol; dissolved in toluene/tetrahydrofuran (5 ml / 1 ml)] is added at 35-40°C within 60 min and stirring is continued overnight at 35-40°C. The resulting reaction mixture is treated with an additional amount of 2,6-dimethoxybenzoyl chloride [3.77 g, 16.9 mmol; dissolved in toluene/tetrahydrofuran (5 ml / 2 ml)] at 35-40°C within 30 min. Stirring is continued for nine hours at 35-40°C.

d) Removal of tetrahydrofuran – oxidation using 30% H₂O₂ at 40-50°C

To the resulting gray suspension is added 50 ml of toluene. Afterwards, 60 ml of solvent (tetrahydrofuran/toluene-mixture) are removed by distillation (100 mbar / 40-50°C). The gray/yellow suspension is diluted with a small amount of toluene (10 ml), and then dropwise treated with H₂O (5 ml) at 50-60°C within 5 min. Stirring is continued for 10 min at 50-60°C followed by the addition of 30% hydrogen peroxide (2.87 g, 25.4 mmol) at such a rate that the temperature is kept between 50-60°C. Stirring is continued for 40 min at 50-60°C. The reaction mixture is diluted with water, extracted once with 5% aqueous NaHCO₃ and twice with water. Drying of the organic phase over Na₂SO₄ and evaporation provides 9.3 g of a yellowish oil. Further purification by preparative liquid chromatography (heptane/ethyl acetate 80:20) yields 1.85 g (18%) of pure 2,4,6-trimethylbenzoyl-2,6-dimethoxybenzoyl-2,4-diphenylphosphine oxide as a yellow viscous oil.

³¹P-NMR (C₆D₆): δ = 15.7.

¹H-NMR (C₆D₆): δ = 8.2-8.3 (dd, 1 H); 7.03 (t, 1 H); 6.7 (s, 2 H); 6.5-6.6 (d, 1 H); 6.4-6.5 (d, 1 H); 6.1-6.2 (d, 2 H); 3.6-3.8 (m, 4 H); 3.28 (s, 6 H); 2.62 (s, 6 H); 2.12 (s, 3 H); 1.6-1.9 (m, 4 H); 1.2-1.5 (m, 8 H); 0.9-1.0 (2 t, 6H).

Example 19 Preparation of bis(pivaloyl)phenylphosphine oxide.

formula I''', R₁ = phenyl, R₂, R₂' = *tert*-butyl;

a) metallation of pentaphenylcyclopentaphosphane

Excluding moisture by an argon atmosphere, sodium pieces (0.64 g, 30 mmol), (PPh)₅ (1.5 g, 13.88 mmol relative to P) are heated under reflux in a mixture of toluene (50 ml) and of TMEDA (N,N,N',N'-tetramethylethylenediamine) (2 ml) until a yellow precipitate is formed.

- 47 -

(PPh)₃ has been prepared as described in the Int. Patent Application PCT/EP 03/50873 by suspending sodium pieces in a mixture of toluene / TMEDA and adding P,P-dichloro-phenylphosphane.

b) Protonation/reduction

Excluding moisture by an argon atmosphere, *tert*-butanol (2.3 g, 2.2 eq.) is added at 100°C over 30 min leading to dissolution of the yellow precipitate. The resulting yellow suspension is further stirred under reflux until all sodium is used up.

c) Acylation and neutralisation of TMEDA

Pivaloylchloride (3.68 g, 2.2 eq) is added dropwise under stirring. The reaction temperature is kept below 70°C. Concentrated H₂SO₄ (0.9 ml) is added dropwise at a temp. below 45°C.

d) Oxidation

30% aqueous hydrogen peroxide (4.3 ml, 42.1 mmol) is added dropwise under stirring at a temperature below 55°C. Stirring is continued at 40-50°C for one hour followed by the addition of water (10 ml). The organic phase is separated and washed twice with water and with 10% NaHCO₃. The organic phase is dried over Na₂SO₄. After evaporation and washing with hexane the title compound is obtained as a yellow solid (1.84 g, 45%).

³¹P-NMR (CDCl₃): δ = 16.2 (t, ³J_{PH} = 10.8 Hz).

¹H-NMR (CDCl₃): δ = 7.80 (m, 2 H, Ph H^(2,6)); 7.57 (m, 1 H, Ph H⁽⁴⁾); 7.48 (m, 2 H, Ph H^(3,5)); 1.27 (s, 18 H, CH₃).

¹³C-NMR (CDCl₃): δ = 132.8 (d, ⁴J_{CP} = 3.1 Hz, Ph C⁴); 132.0 (d, ²J_{CP} = 8.3 Hz, Ph C^{2,6}); 128.7 (d, ³J_{CP} = 11.4 Hz, Ph C^{3,5}); 126.6 (d, ¹J_{CP} = 79.2 Hz, Ph C¹); 25.6 (s, CH₃).

Comparative Example: ethanol vs. *tert*-butanol as proton source in the protonation / reduction step.

Step b) of Example 2 has been repeated using two equivalents (with regard to P) of ethanol instead of *tert*-butanol. Gas develops heavily. Selectivity data are obtained by ³¹P-NMR. The ³¹P-NMR experiments were conducted on Bruker DPX-250 spectrometers.

2 eq. (P) Na + 2 eq. <i>tert</i> -BuOH in toluene / TMEDA, after 2.5 h reflux: clear yellow solution.	2 eq. (P) Na + 2 eq. EtOH in toluene / TMEDA, after 2.5 h reflux: cloudy orange solution.
